

- Agency Profile named AGY<PCC> (e.g. AGY3YAB for 3YAB PCC) is created.
- Agency Profile contains Client ID data in the Hotel Preferences section (see screen #21)
- “Vendor Code” field in the profile is “Id”, “Discount ID” field contains the Client IDs that should be pre-populated in the hotel search
- **Rate loading only works if using SABRE CSL rate codes are loaded in SABRE profiles- if you use native SABRE this will not work you will have to continue searching HFH/EZR in your hotel format**

Note: In this case the profile doesn’t have to be copied to the PNR. If the name of the profile matches the above assumptions, then the Client IDs are pre-populated in the field automatically.

The screenshot shows the Sabre Profiles interface for profile AGY3YAB. The main section is titled "Hotel Preferences" and contains two discount entries. Each entry has a "Vendor Code" dropdown set to "Id", a "Discount ID" field, and a "Discount Type" dropdown. The first entry has "HFH" in the Discount ID field, and the second entry has "EZR" in the Discount ID field. The interface includes a left-hand navigation menu with options like "Agency Information", "Air Preferences", and "Hotel Preferences". At the bottom right, there are "Cancel" and "Continue" buttons.
